

Important Short questions on UNIX By SubhaDa (9804380267/8697101010)

- ① Kill command can be — used by a user to kill his process.
- ② All the contents of a file are stored in — super block.
- ③ Global file information about disk uses are stored in — super block.
- ④ Inode does not contain — name of the file.
- ⑤ P1|P2 will — append standard output of P1 to P2
(Example of pipeline/pipe)
- ⑥ To append f1 and f2 to end of a file tmp, command is —
cat f1 f2 > tmp
- ⑦ 'grep' stands for — globally search a regular expression and print.
- ⑧ Regarding storage allocation pipe uses — only direct block.
- ⑨ Daemons are process that are not connected with the — system.
- ⑩ Process id is assigned by — process itself
- ⑪ init process has 1 PID.
- ⑫ The & is used to — make the job run faster / run it in the background
- ⑬ Zombie is a state when — the process is alive.
- ⑭ The ~~process~~ command used for increasing the priority of a process is — nice.
- ⑮ TCP is connection oriented protocol / UDP is connection less protocol.
- ⑯ Write UNIX command — to take input from the file IN and to write its sorted output to the file OUT — \$sort IN > OUT
- ⑰ To count frequency of a particular word in a file (UNIX) —
\$grep -c 'abc' sample.txt
- ⑱ When we execute a shell script, the shell acts as — an interpreter.
- ⑲ \$# — number of arguments supplied to the shell script.
- ⑳ X=10, Y=20 to multiply (UNIX) — expr \$x * \$y
- ㉑ A shell is used because to protect OS from inadvertent unsafe access to kernel space.
- ㉒ The shell parameter \$! represents — PID of last background process.
- ㉓ What does the redirection symbol "<>" do — redirect standard input.
- ㉔ expr -f %d evaluates to — (-1)
- ㉕ Kernel is not involved — when a read operation is done.

* Important SQ/MCQ on UNIX by SubhaDa (8697101010) *

- (35) If umask is set to 777 then what permissions will you get for a newly created directory — drwxrwxrwx
- (37) Super block contains — file size and how many maximum files it can accommodate.
- (38) Which command will show the kernel version of UNIX — uname
- (39) The command for deleting a directory which is not empty — rm -r
- (30) How many options are there in this command —
ls -cut chap1 chap2 (Ans) 2.
- (31) How to create a new file without opening it — Touch filename.
- (32) All the contents of file are stored in — data block
- (33) What is the representation of the permission rwxr-xrwx? (756)
- (34) To change the userID and the groupID of a file, use chown().
- (35) To copy an entire directory structure we need — cp -r olddir newdir
- (36) The default system wide permissions for a file are 644 and that for a directory are 777 (644, 777)
- (37) Which command is used for changing permission — chmod
- (38) The part of OS is responsible for execution of a shell program — shell
- (39) 'ls' is a — external command + internal command
- (40) Different type of files available in UNIX — Regular file, directory, Executable links, Device file, Named pipe.
- (41) Shell is the interface between — kernel and User.
- (42) Name of current month — date + %m
- (43) The type of kernel that gets completely copied to the primary memory while booting is called — Monolithic kernel
- (44) Which is not a task of UNIX kernel — filter management.
- (45) Super user has the default prompt — #
- (46) UNIX support — multi-user and multi-tasking.
- (47) If you want to quit without saving current work, you need to use — q!
- (48) The available disk space can be determined under UNIX using the command — df
- (49) What is the output of A=15; echo "\$A" — 15
- (50) UNIX is an — operating system (os). (scripting, interpreter)
UNIX shell is both and and.
